## **REMARKS**

Claims 1-23 are pending in the Application.

The Examiner rejected claim 1-7 under 35 U.S.C. § 103 as being unpatentable over various combinations of documents.

Applicant has amended claims 1-7 and added claims 8-23. Regarding amended claim 8, support (not limitation) may be found, for example, in the disclosure of "a web browser for the World Wide Web (WWW). . . . a user sends . . . message requesting a coupon for a specific product, by invoking the browser to select Hypertext in a document advertising the product." Specification as originally filed, paragraph 84.

Regarding amended claim 9, support (not limitation) may be found, for example, in the disclosure that "address for the user of PC 400 be sent by a web browser for the World Wide Web (WWW). With one scheme, a user sends an Email message requesting a coupon for a specific product, by invoking the browser to select Hypertext in a document advertising the product." Specification as originally filed, paragraph 84.

Regarding amended claim 10, support (not limitation) may be found, for example, in the disclosure that "[t]o implement this second method, it is presently preferred that the Email address for the user of PC 400 be sent by a web browser for the World Wide Web (WWW). With one scheme, a user sends an Email message requesting a coupon for a specific product, by invoking the browser to select Hypertext in a document advertising the product. Selection of the Hypertext invokes a "Form" in the document, causing the browser to prompt the user . . ." Specification as originally filed, paragraph 84.

The Examiner rejected claim 1 under 35 U.S.C. § 103 as being unpatentable over

Jovicic et al. [US 5,855,007] in view of Nemirofsky [US 5,953,047], and Valencia et al. [US 5,380,991]. (Office Action page 3).

Applicant submits that claim 1, as amended, is nonobvious in view of the art of record, and otherwise complies with the statutes and regulations.

Jovicic et al. discloses an "electronic coupon communication system for generating and redeeming unique product discount coupons over public computer networks such as the Internet. . . . The Internet coupon server accepts an on-line selection of one of the available unique Internet coupons from a user of the Internet node and transmits the coupon back to the user's printing device or e-mail storage. It then records the transaction in its coupon database and notifies the transaction to the Internet Coupon Notification Center. The Internet Coupon Notification Center subsequently records the transaction."

Jovicic et al. Abstract.

"According to the [Jovicic et al.] invention, user's general computing device connected to the public network such as the Internet 122, establishes an on-line session with the Internet Coupon Server 124, preferably goes through the registration process 408 if the user is a new user, and then, after the coupon generation process 410 described in detail below, makes a selection 412 from the available coupons in the Internet Coupon Server's browsing memory 128 . . ." Jovicic et al. col. 7, lines 56-64.

"Once the user viewing the display 116 selects an electronic coupon 300 being displayed, such as by entering user input at the keyboard 114, the Internet Coupon Server 124 may ask the user to choose if the coupon is to be mailed electronically, Internet Coupon Server 124 prompts the user to input an electronic mail address 418. When electronic mail address is imputed, Internet Coupon Server 124 mails the coupon

electronically to the addressee 420." Jovicic et al. col. 8, lines 10-17.

"An added feature of the invention is that the user may choose to e-mail the coupon to him or herself allowing him or her to store the coupon for a later date handling or to send it directly to the vendor's Internet node over public computer network." <u>Jovicic et al.</u> col. 8, lines 18-23.

The Examiner concedes that <u>Jovicic et al.</u> does not disclose writing the coupon data onto a smart card, but reasoned that "<u>Nemirofsky</u> discloses transmitting coupon data to a computer screen over a computer network and writing the coupon data onto a smart card [col 8, lines 20-24]. Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the invention of <u>Jovicic et al.</u> to include the method disclosed by <u>Nemirofsky</u>. <u>Nemirofsky</u> provides the motivation that the invention <u>achieves</u> real-time interactivity and <u>is convenient for consumers</u>." (Office Action, page 4) (emphasis added).

The Examiner stated "<u>Valencia</u> discloses a paperless coupon redemption system and method that includes a smart card . . . Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the invention of <u>Jovicic et al.</u> to include the method disclosed by <u>Valencia et al.</u> <u>Valencia</u> provides the motivation that the method allows a shopper to obtain the benefit of reduced prices for certain items <u>without</u> the necessity of redeeming paper coupons." (Office Action, page 4) (emphasis added).

In contrast, amended claim 1 recites, inter alia, a method of downloading a coupon for a product onto a smart card held by a user having access to a user computer that is in bi-directional communication with a global computer network. The method comprises, *inter alia*, transmitting to the user computer data referring to the product; <u>subsequently receiving</u>

from the user computer, via the global computer network, data indicating that the user desires to receive a coupon for the product; and writing the coupon data onto the smart card with the smart card reader/writer. No reasonable combination of the art of record suggests claim 1's peculiar combination including the recited steps of bi-directional coupon-related communication via the global computer network, yet writing the coupon data onto a smart card.

The Examiner stated it would have been obvious "to modify the invention of <u>Jovicic et al.</u> to include the method disclosed by <u>Nemirofsky</u>. <u>Nemirofsky</u> provides the motivation that the invention <u>achieves real-time interactivity</u> and <u>is convenient for consumers</u>." (Office Action, page 4) (emphasis added). This statement by the Examiner is inapplicable to claim 1, as amended. The addition of <u>Nemirofsky</u>'s card writing to <u>Jovicic et al.</u> would not increase the interactivity of <u>Jovicic et al.</u> Furthermore, such a modification of <u>Jovicic et al.</u> would be <u>less</u> convenient for consumers. In <u>Jovicic et al.</u>, without the Examiner's attempted modification, the consumer may avoid paper coupons by using electronic means, thereby avoiding all carrying of materials. Modifying <u>Jovicic et al.</u> to require the carrying of a smart card would be a less convenient for consumers.

In other words, given that the user of the <u>Jovicic et al.</u> system may direct an electronic coupon via a network, there would have been no motivation to write the coupon onto a card that the user would then be required to carry. In fact, because of this relative inconvenience, one would have been disinclined to write <u>Jovicic et al.</u>'s network coupon onto a card.

The Examiner's reliance on <u>Valencia</u>, as the purported motivation to modify <u>Jovicic</u> <u>et al.</u>, is also inapplicable to amended claim 1. The Examiner stated, "<u>Valencia</u> provides

the motivation that the method allows a shopper to obtain the benefit of reduced prices for certain items without the necessity of redeeming paper coupons." (Office Action page 4). Applicant notes, however, that there is already no necessity of redeeming paper coupons in <u>Jovicic et al.</u>'s system. Thus, this motivation proffered by the Examiner is nonexistent.

In summary, "It is impermissible within the framework of section 103 to pick and choose from any one reference only so much of it as will support a given position, to the exclusion of other parts necessary to the full appreciation of what such reference fairly suggests to one of ordinary skill in the art". *In re Wesslau*, 353 F.2d at 241, 147 U.S.P.Q. at 393. Thus, one cannot take <u>Jovicic et al.</u>'s network-based selection of electronic coupons while discarding <u>Jovicic et al.</u>'s network-based redemption of electronic coupons, when <u>Jovicic et al.</u>'s network-based redemption is more convenient than the card-based redemption that the Examiner attempts to import from the other references.

The Examiner rejected claims 2-4 under 35 U.S.C. 103(a) as being unpatentable over <u>Jovicic et al.</u> in view of <u>Nemirofsky</u>, <u>Valencia et al.</u>, and <u>Christensen et al.</u> [U.S. Patent 5,710,886].

Jovicic et al., Nemirofsky, and Valencia et al. are described above.

Applicant notes that <u>Christensen et al.</u> disclose "a SELLECTSOFT™ diskette may be created containing coupon information and program data for displaying and generating coupons." <u>Christensen et al.</u> col. 5, lines 31-34. "[T]elemarketing personnel may request consumer demographic and or identification information which may be entered into a centralized database. Once the software is validated, a consumer may print out selected coupons displayed on a Graphical User Interface (GUI)." <u>Christensen et al.</u> Abstract.

The Examiner cites Christensen et al. col. 8, line 42 - col. 9, line 8, which states:

"From instruction screen 5, the user may proceed to main menu screen 6. FIGS. 12-13 illustrate the further operation of the menu system. A consumer may click on a general category, and then click on more specific categories within that general category . . . . When a validation number has been previously entered, a user may proceed directly to instruction screen 5 or main menu screen 6 once the SELLECTSOFT™ software has been loaded." . . . A user may browse through screens of coupons within a category, or through various screens in various categories, as illustrated in FIGS. 12 and 13. In addition, a simple text search engine may be provided to enable the consumer to quickly find coupons of interest. A consumer may enter a word or portion of a word defining a brand name, category, or generic product name. The SELLECTSOFT™ software may then display a coupon or coupons."

Thus, Christensen et al. cannot make up for the deficiencies in the other references already cited, and claim 2 is patentable as it recites, *inter alia*, a method of downloading a coupon for a product onto a smart card held by a user having access to a user computer that is in <u>bi-directional</u> communication with a global computer network. The method comprises, *inter alia*, transmitting to the user computer by using an address associated with the user computer, via the global computer network, data referring to the product; <u>subsequently receiving from the user computer</u>, via the global computer network, data indicating that the user desires to receive a coupon for the product; writing the coupon data onto the smart card with the first smart card reader/writer; reading the coupon data with the second smart card reader/writer. No reasonable combination of the art of record suggests claim 2's peculiar combination including the recited steps of bi-directional coupon-related communication via the global computer network, yet writing the coupon data onto a smart

card.

Claim 3, as amended, is patentable as it recites a method of downloading a coupon for a product onto a smart card held by a user having access to a user computer that is in bi-directional communication with a global computer network. The method comprises, *inter alia*, transmitting to the user computer by using an address associated with the user computer, via the global computer network, data referring to the product; subsequently receiving from the user computer, via the global computer network, data indicating that the user desires to receive a coupon for the product; writing the coupon data onto the smart card with the first smart card reader/writer.

Claim 4, as amended, is patentable as it recites *inter alia*, transmitting to the user computer by using an address associated with the user computer, via the global computer network, data corresponding to a coupon for a product; subsequently receiving from the user computer, via the global computer network, data indicating that the user desires to receive the coupon; transmitting to the user computer by using the address, via the global computer network, data representative of the coupon that is capable of being written onto the smart card by the user smart card reader/writer.

The Examiner rejected claim 5 under 35 U.S.C. 103(a) as being unpatentable over <u>Jovicic et al.</u> in view of <u>Jones</u> [US 5,500,681], and <u>Valencia et al.</u>

Jovicic et al. and Valencia et al. are described above.

Jones discloses that "Coupon information is stored in a memory at a cable television station . . . The video signal may at times, such as during a product advertisement or other offer, include an embedded coupon identifier. A coupon subsystem at the cable television station monitors each video signal and retrieves token information from a database when it

detects a corresponding embedded token identifier. The coupon information is transmitted over a data channel on the cable network. A subscriber unit at the television viewer's site receives the data channel and extracts the coupon information. The television programming aurally or visually alerts the viewer that a coupon may be generated. If the viewer actuates an input device, such as a button on a television remote control, a printer generates a coupon bearing the coupon information." <u>Jones Abstract</u>.

The Examiner stated, "Jones et al discloses transmitting selected coupon to a user through the use of a packet [col 4, lines 9-27 and 39-49]. Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the invention of <u>Jovicic et al.</u> to include the method disclosed by <u>Jones et al.</u> to transmit longer messages more efficiently and reliably." (Office Action pages 7-8).

Thus, <u>Jones</u> cannot make up for the deficiencies in the other references already cited, and claim 5 is patentable as it recites, *inter alia*, a method of receiving and redeeming coupons, redeemable at a store, with a smart card with a computer in <u>bi-directional</u> communication with a global computer network. The method comprises viewing a plurality of available downloadable coupons, received in a packet having an address associated with the user computer in the global computer network, on the computer monitor; subsequently generating an input to the computer indicating a selection of a selected coupon from the plurality of available downloadable coupons, to cause the computer to send data, corresponding to the selected coupon, into the global computer network; subsequently receiving data corresponding to the selected coupon, the received data having been transmitted using the address through the global computer network after step (b), and causing the received data to be written to the smart card.

The Examiner rejected claim 6 under 35 U.S.C. 103(a) as being unpatentable over Valencia et al. in view of Jovicic et al. and Nemirofsky et al. 1

Valencia et al., Jovicic et al., and Nemirofsky are described above.

In contrast, claim 6 is patentable as it recites an electronic coupon downloading apparatus, comprising a processor in bi-directional communication with a global computer network; and program instructions that receive a user selection, send the received selection through the global computer network, receive coupon data corresponding to the selection, the received coupon data having been transmitted through the global computer network after the program instructions send program sends the corresponding selection through the global computer network; and cause the processor to write coupon data that is received via the global computer network onto a smart card. No reasonable combination of the art of record suggests this peculiar combination including program instructions to cause the recited writing of coupon data after the recited bi-directional communication.

The Examiner rejected claim 7 under 35 U.S.C. 103(a) as being unpatentable over Christensen et al. in view of Jovicic et al., Nemirofsky, and Valencia et al.

<u>Christensen et al.</u> in view of <u>Jovicic et al.</u>, <u>Nemirofsky</u>, and <u>Valencia et al.</u> are described above.

In contrast, claim 7 is patentable as it recites a processor in bi-directional communication with a global computer network; user program instructions a program that receive receives a user selection, sends the received selection through the global computer network, receive receives coupon data corresponding to the selection, the

<sup>1.</sup> Applicant assumes that the Examiner is citing to U.S. Patent No. US 5,953,047 to Nemirofsky et al.

received coupon data having been transmitted through the global computer network after

the program instructions send program sends the corresponding selection through the

global computer network; and cause causes the processor to write coupon data that is

received via the global computer network onto a smart card via the first smart card

reader/writer. No reasonable combination of the art of record suggests this combination

including program instructions to cause the recited writing of coupon data after the recited

bi-directional communication.

If the Examiner has any questions about this amendment, applicant's representative

would appreciate discussing this amendment with the Examiner. Applicant's

representative, Jerome Jackson, can be reached at 703-684-4840.

Respectfully submitted,

DATED: 22 OCT 2007

Jerome D. Jackson
